

Presentation of Interactive Dashboard & Insight Report

Presented By – Impact Makers(Team 5)

Interactive Dashboard File/Link

An interactive Power BI dashboard was created to visualize key trends in the dataset, including student demographics and program preferences. It enhances data interpretation through dynamic charts and can be accessed via the link provided.

Dashboard Design Documentation

Dashboard Layout and Structure Description

The dashboard is organized as a top-down information hierarchy, designed to show stakeholders high-level metrics first before they go deeper into all the details.

- **Header and Branding:** The header contains the DePaul University logo and institutional images to target success as an immediate brand experience for a professional setting.
- **Overall KPI Summary:** A series of Card Visuals that act as a summary ribbon directly below the header. These offer a pulse check on key recruitment funnel KPI measures: Total Applicants, Total Admitted and Admission Rate.
- **Header:** The Main Content Area

Component Rationale: These Are the Visuals You Will See and Why

The individual components were chosen to yield actionable wonderings for Excelerate about DePaul's admission health.

- **Total Applicants Card:** Added to track the Top of the Funnel. This is a key statistic revealing the marketing reach and general brand awareness resulting from activities undertaken by Excelerate.

- **Total Admitted Card:** Added to track Qualified Conversion This removes students who do not meet DePaul's academic standards from the total applicant number, which highlights just how good those leads being generated really are.
- **Selective Metric card:** Admission Rate (%) This is the balance of institutional demand, and with selectivity.
- **Language Schema (Question and Answer):** It is quite a strong element

Data Flow and Interactivity Overview

This dashboard is powered by a complex back-end model: everything happens here in stride, so all the elements are synchronized and you see movement.

- **Centralized Data Model:** All of the visuals are based on a master Data Model managing connections between individual's demographics, time and status.
- **Interactivity Through Cross-Filtering:** The interactivity of a dashboard is top notch. When you click on a particular data point in the chart, this action applies filters to these KPI cards automatically to show the exact (filtered) rows according to your selection.
- **Linguistic Processing:** The data model has schemeless, allowing it to converse with non-technical audiences through user synonyms and queries; hence the creation of a Conversational interaction layer in its design.

Demo Video

A demo video of the interactive dashboard has been created to provide a clear understanding of its features and functionality. The video demonstrates how users can navigate through different visuals, apply filters, and interpret key insights related to student demographics, program preferences, and application trends.

It highlights the dynamic nature of the dashboard, showing how data can be explored in real time to support analysis and decision-making. The demo also showcases important visuals such as country distribution, program demand, and intake patterns.

The video can be accessed using the following link:

Insight Report

The dashboard shows that most applicants come from India, with growing contributions from countries like Ghana and Nigeria. There is a strong preference for STEM programs such as Computer Science and Data Science, and the Fall intake receives the highest number of applications. The data also indicates reliance on a few key feeder institutions, suggesting limited diversification in recruitment sources.

Key Recommendations

- Expand recruitment to new regions to diversify the student base
- Strengthen engagement strategies using interaction insights
- Focus resources on Fall intake while promoting less popular programs

Conclusion

The dashboard enables data-driven decision-making by clearly highlighting trends in student demographics and program demand, helping improve recruitment strategies and admission planning.
